ABSTRACT OF THE DISCLOSURE

A system and method for providing graphical representations for selected properties. The system draws each item based on the type of property being shown. For example, for selected types of properties, the drawing may be delegated to a drawing handler component for that specific type of property. For example, if a music rating is being displayed, a special drawing handler component handles the drawing, which, in one example embodiment may be a number of graphical stars. The system is architected so that the drawing handlers are registered independently of the other system components, such that new types of drawing handlers can be added without requiring changes to the other system components. This allows for greater flexibility and simplifies updates to the drawing handlers.
